New taxa of *Aristolochia* (Aristolochiaceae) from Thailand

LEENA PHUPHATHANAPHONG*

ABSTRACT. Five new species of the genus *Aristolochia* (Aristolochiaceae) from Thailand are described and illustrated. They are *Aristolochia hansenii* Phuph., *A. kongkandae* Phuph., *A. perangustifolia* Phuph., *A. poomae* Phuph. and *A. yalaensis* Phuph.

INTRODUCTION

Since the publication of *Aristolochia* in the Flora of Thailand (Phuphathanaphong 1987) two new species have been added by Hansen & Phuphathanaphong (1999). The new species, *Aristolochia phetchaburiensis*, described by Chuakul & Saralamp (2001) is a synonym of *A. kerrii*. Recently additional material has been collected and among these collections five hitherto undescribed species have been found, two of these from northern, two from peninsular and one from northeastern Thailand.

*Aristolochia hansenii* Phuph. sp. nov. Haec species nova affinis est *A. pierrei* Lecomte sed caule tenuiore, petiolo longiore, foliis parvioribus utrinque glaberrimis, fructibus parvioribus et seminibus exalatis differt. Typus: Thailand, Northern, Chiang Rai, Mae Fa Luang district, on the way to Ban Hin Taek, 16 September 1998, Chayamarit 1120, (holotype BKF; isotype C). Fig. 1.

Slender climber, stem zigzag, 1–2 mm diam., glabrous, slightly grooved. Leaves without pseudo-stipules; petiole 1.5–4 cm, slender, glabrous; lamina thin, narrowly lanceolate, 5.5–8.5 by 2–3.5 cm, base shallowly cordate, sinus 5–10 mm deep, 8–12 mm wide, margin entire, apex tapering acute, mucronate, glabrous on both surfaces except some minute hairs on nerves near base, densely minute gland dotted on both surfaces, palmately 5-nerved, pinnately 3–4 nerved along midrib, venation inconspicuous above. Inflorescences axillary, racemose, 1.5–5 cm long, 3–5-flowered; bracts lanceolate to ovate-lanceolate, 5–8 by 2–3.5 mm; peduncle 2–3 mm, pedicels 4–6 mm pubescent; ovary elongate, 2–3 by 0.5–1 mm, 6-lobed, densely short hairy; with a stipe of 2–3 mm between ovary and utricle. Perianth dark violet, utricle ovate, 5–7 by 3–4 mm, tube cylindric, 4–5 by 1 mm, straight; limb 1-lipped, lanceolate, ca. 2.5 by 5 mm, apex acute, glabrous, longitudinally striate. Gynostemium ca. 1.7 by 1.3 mm. Stamens 6, anthers oblong, ca. 0.7 by 0.1 mm. Stigmatic lobes 6, long triangular, ca. 0.6 by 0.3 mm, obtuse; with 6 small lobes between stigmatic lobes and anthers. Fruit globose, 8–10 mm in diam., longitudinally 6-lobed, green, glabrescent. Seeds cordate, not winged, 2.5–3.5 by 2.5–3.5 mm., slightly verrucose on adaxial surface, verrucose on abaxial surface, light brown.

Figure 1. *Aristolochia hansenii* Phup.: A. flowering and fruiting branch; B. gynostemium; C. abaxial surface of seed; D. adaxial surface of seed; E. bracts and ovaries. Drawn by P. Inthachup.
Thailand. — NORTHERN: Chiang Rai [Mae Fa Luang, on the way to Ban Hin Taek, 16 September 1998, Chayamarit 1120 (BKF, C)].

Distribution. — Endemic, only known from the type locality.

Ecology. — Edge of evergreen forest, creeping on the ground.

Vernacular. — Krachao chiangrai (คำเรียกชื่อพืช).

Note. — This new species is closely related to Aristolochia pierrei Lecomte but differs in having a thinner stem, a longer petiole, smaller leaves and in being glabrous on both leaf surfaces; also the fruit is smaller and the seeds are without a wing. (Table 1). The specific epithet is given in honour of the late Dr. Bertel Hansen, my advisor when I revised the family Aristolochiaceae at the Botanical Museum, University of Copenhagen.

Aristolochia kongkandae Phuph. sp. nov. Haec species nova affinis est A. pierrei Lecomte sed caule tenuiore et breviore, petiolo longiore, foliis parvioribus ovato-lanceolatis (nec lanceolatis vel late lanceolatis), glabris (nec pubescentis), apice mucronatis (nec acutis vel acuminitis), fructibus parvioribus globosis, et seminibus trigonaliter obovatis exalatis basaliter (nec ubique) verrucosis differt. Typus: Thailand, Peninsular, Surat Thani, Khlong Phanom NP, 21 February 2001, Chayamarit et al. 2607 (holotype BKF; isotypi C, E). Fig. 2.

Slender climber, stem glabrous 1–1.5 mm diam., slightly grooved. Leaves without pseudo-stipules; petiole 3–7 cm, slender, glabrous; lamina ovate to ovate-lanceolate, 5–7.5 by 3–4 cm, base deeply cordate, ± auriculate, sinus 6–13 by 3–20 mm, margin entire, apex acute to acuminate, mucronate; glabrous on both surfaces, palmately 5–7 nerved, pinnately 2–3-nerved along midrib, veinlet finely reticulate, inconspicuous on both surfaces. Inflorescences axillary, racemose 1.5–4 cm long, 2–5-flowered, bracts and bracteoles lanceolate, 1–1.5 by 0.3–0.5 mm, glabrous, pedicel ca. 5 mm, pedicels 5–7 mm, glabrous. Ovary elongate, ca. 4 by 0.8 mm, slightly 6-ridged, glabrous, with a stipe of 0.5–1.5 mm between ovary and utricle. Perianth reddish green, utricle short cylindric to globose, ca. 5 by 3 mm., base truncate, apex contracted, tube slender cylindric, curved upwards, ca. 10 by 1.5 mm; limb 1-lipped, oblong ca. 1.5 by 0.5 cm, apex acute, glabrous. Gynostemium ca. 1.5 by 1 mm. Stamens 6, anther oblong to elliptic ca. 0.5 by 0.2 mm. Stigmatic lobes 6, ovate, obtuse. Fruit globose, 5–7 mm diam., longitudinally 6-lobed, glabrous, greenish. Seed triangular-obcordate, not winged, ca. 2.5 by 2.1 mm, verrucose on both surfaces.

Distribution. — Endemic, confined to Peninsular Thailand.

Ecology. — In evergreen forest, hanging down on limestone cliff.

Vernacular. — Krachao klong phanom (คำเรียกชื่อพืช).

Note. — This new species is closely related to Aristolochia pierrei Lecomte but differs in having thinner and shorter stems, smaller leaves with longer petioles, a glabrous lamina which is ovate to lanceolate-ovate and with an acute to acuminate and mucronate...
Figure 2. Aristolochia kongkandae Phuph.: A. flowering branch; B. fruiting branch; C. abaxial surface of seed; D. adaxial surface of seed; E. gynostemium. Drawn by P. Inthachup.
apex (the lamina is hairy, lanceolate to broadly lanceolate, and the apex is acute or tapering acute in A. pierrei). The fruits are smaller and spherical. The seeds are triangular-obovate, not winged, and verrucose on the lower surface (they are verrucose on both surfaces in A. pierrei) (Tab. 1). The species is named in honour of Dr. Kongkanda Chayamarit, Director, Office of the Forest Herbarium, who encouraged and provided facilities for my work.

Aristolochia perangustifolia Phuph. sp. nov. Haec species nova affinis est A. pierrei Lecomte sed foliis angustioribus basaliter distincte cordatis rotundate auriculatis differt, limbis perianthii linearo-lanceolatis (nec oblongis) instructa, cum annulo sinuato inter lobos stigmatis et antheras qui deest in A. pierrei. Typus: Thailand, North-eastern, Khon Kaen, Pha Nok Khao, near Phukradung, 29 October 1984, Murata et al T-51751 (holotype BKF; isotype KYO). Fig. 3.

Slender climber, 1–1.5 mm diam., stem glabrous, slightly grooved. Leaves without pseudo stipules; petiole 1.5–2 cm, slender, glabrous; lamina thin, narrowly lanceolate, 5.5–8.5 by 1.3–1.8 cm, base deeply cordate, auriculate, auricle rounded, the sinus 7–12 mm deep, 5–7 mm wide, margin entire, apex tapering acute or acuminate, mucronate, glabrous on upper surface, pubescent and densely minute gland-dotted on lower surface, palmately nerves 3–5; veins inconspicuous above, loosely reticulate visible below. Inflorescences axillary, racemose, 5.5–8 cm long, 1–6-flowered, bracts lanceolate to linear-lanceolate, 6–8 by 1–1.5 mm, gland-dotted, longitudinally veined, peduncle 5–6 mm, pedicels 6–12 mm, puberulous; ovary elongate, 3–4 by 0.5–1 mm, 6-ridged, glabrous, without stipe between ovary and utricle. Perianth reticulate, outside glabrous, utricle globose, ca. 4 mm diam., tube slightly bent upwards, 6–8 by 2–3 mm, limb 1-lipped, linear-lanceolate, 20–25 by 2–3 mm, tapering at apex, on adaxial surface of lip and throat pubescent. Gynostemium ca 1.5 by 1.3 mm. Stamens 6, anther oblong, ca 0.7 by 0.05 mm. Stigmatic lobes 6, oblong or oblong lanceolate, 0.4–0.5 by 0.1–0.2 mm, with 6 wavy lobes between stigmatic lobes and anthers. Fruit not seen.

Thailand.— NORTHEASTERN: Khon Kaen [Pha Nok Khao, near Phukradueng, 29 October 1984, Murata et al T-51751 (BKF, KYO)].

Distribution.— Endemic, only known from the type locality.

Ecology.— Edge of mixed deciduous forest in limestone areas, altitude 280–450 m (altitude data from the label on Murata et al. T-51751).

Vernacular.— Krachao bai khaeb (กระเจ้าใบแคบ).

Note.— This new species is closely related to A. pierrei Lecomte but differs in having narrower leaves with a deeply cordate base and rounded auricles. The perianth limb is linear-lanceolate, while it is oblong in A. pierrei. There is a wavy annular ring between the stigmatic lobes and anthers in which is absent in A. pierrei (Table 1).

Aristolochia poomae Phuph. sp. nov. Haec species nova affinis est A. chlamydophyllae C.Y. Wu sed foliis parvioribus, petiolis brevioribus, utriculis oblongo-ovatis (nec globosis), laminis foliorum linearo-lanceolatis (nec ovato-lanceolatis), et lobis stigmatis brevioribus lactoribusque differt. Typus: Thailand, Northern, Chiang Mai, Maesa Botanical Garden (QSBG), Maerim, alt. 700 m, 17 August 1989, Pooma 268 (holotype BKF). Fig. 4.
Figure 3. *Aristolochia perangustifolia* Phup.: A. flowering branch; B. inflorescence; C. gynostemium. Drawn by P. Inthachup.
Slender climber, stem glabrous, slightly grooved, 1–1.5 mm diam.. Leaves without pseudostipules; petiole 2–3 cm, slender, glabrous; lamina thin, ovate to lanceolate-ovate, 5.5–9 by 2.5–3.8 cm, base deeply cordate, auriculate, auricles rounded, the sinus 8–15 mm deep, 5–7 mm wide, margin entire, apex acuminate, mucronate, glabrous on upper surface, pubescent and densely minute gland-dotted on lower surface, palmately 5–7-nerved; veins inconspicuous above, loosely reticulate and slightly elevated below. Inflorescences axillary, racemose, 2–5 cm long, 1–4-flowered, bracts ovate-lanceolate, 5–8 by 2–3 mm, pubescent. Peduncle up to 12 mm, pedicels ca. 5 mm; pubescent; ovary elongate, ca. 2 by 0.5 mm, 6-ridged, densely short hairy, without stipe between ovary and utricle. Perianth purplish-cream, glabrous, gland-dotted; utricle oblong-ovate, 5–6 by 3–4 mm, 6-lobed, tube bent upwards, 4–8 by 1 mm, limb 1-lipped, linear-lanceolate, 12–16 by 1.5–3 mm, tapering at apex, straight, base of lip and throat inside dark purple, pubescent. Gynostemium ca. 1 by 1.4 mm. Stamens 6, anthers oblong, ca. 0.5 by 0.13 mm. Stigmatic lobes 6, ca. 0.3 by 0.7 mm, short, obtuse to nearly truncate. Young fruit ovate-oblong, ca. 17 by 8 mm, longitudinally 6-lobed.

Thailand.—NORTHERN: Chiang Mai [Maesa Botanical Garden (QSBG), Maerim, alt. 700 m, 17 August 1989, Pooma 268 (BKF)].

Distribution.—Endemic, only known from the type locality.

Ecology.—Edges of dry evergreen forest, altitude 700 m.

Vernacular.—Krachao nok krasa (คราชะอโนกกระสา).

Note.—This new species is named in honour of Dr. Rachun Pooma who collected the plant when he was a chief of Maesa Botanical Garden, (now QSBG: Queen Sirikit Botanic Garden). It is closely related to A. chlamydophylla C.Y.Wu but differs in having smaller leaves and a shorter petiole. The utricle is oblong-ovat, while in A. chlamydophylla it is globose; the limb is linear-lanceolate while in A. chlamydophylla it is ovate-lanceolate; and the stigmatic lobes are shorter and wider than in A. chlamydophylla (Table 2).

Aristolochia yalaensis Phuph. sp. nov. Haec species nova affinis est A. minutiflorae Ridl. ex Gamble sed inflorescentiis racemosis 1–4 in quaque axila et utriculis sine corpore glandulosi differt. Typus: Thailand, Peninsula, Yala, Bannang-sta, alt. 180–200 m. 17 July 2004, Pooma et al. 4321 (holotype BKF; isotypes K, L). Fig. 5.

Climber, ca. 1.2 m, young stem pubescent, glabrescent, slightly grooved, 1–2 mm diam.. Leaves without pseudostipules; petiole 4–6 cm, glabrous, lamina ovate-cordate, 7–12 by 4.5–8 cm, base deeply cordate, auriculate, with a basal sinus 1–2 cm deep and 1.3–3 cm wide, auricles rounded, margin entire, apex acuminate, with or without a minute mucro, glabrous above, pubescent below but surface clearly showing palmately 5–7-nerved. Inflorescences racemose, 1–4 in axil of foliage leaves and also on leafless stem, up to 4.5 cm long, rachis 2.5–3.5 cm, 3–5-flowered, each flower opposed by a sessile lanceolate bracteole, 3.5–5 by 1.5–2 mm, apex acuminate, basal nerves 3–5, pubescent on both surfaces, pedicel ca. 5 mm, pubescent, ovary ca. 3 by 0.5 mm, 6-lobed, pubescent, pale green, without stipe between ovary and utricle. Perianth 2 cm long, pale green, puberulous, bent between utricle and tube, utricle ovoid to globose, ca. 3 by 3 mm, tube ca. 4 by 1.5 mm, throat purple with 4 longitudinal lines, limb around the throat with a long tapering lip on the upper part,
Figure 4. *Aristolochia poomae* Phup.: A. flowering branch; B. inflorescence; C. gynostemium. Drawn by P. Inthachup.
ca. 10 by 3 mm, apex obtuse, densely pubescent inside. Gynostemium ca. 0.8 by 2 mm. Stamens 6, anther oblong, ca. 0.7 by 0.5 mm. Stigmatic lobes 6, triangular, ca. 0.5 by 0.5 mm, acute. Fruit only known in young state, ca. 7.5 by 5 mm.

Thailand.— PENINSULAR: Yala [Bannang-sta, alt. 180–200 m. 17 July 2004, Pooma et al 4321 (BKF, K, L)].

Distribution.—Endemic, only known from the type locality.

Ecology.— In evergreen forest, on limestone, altitude 180–200 m.

Note.— This new species is closely related to A. minutiflora Ridl. ex Gamble but the inflorescences are racemose, 1–4 in axil, and the utricle is without glandular bodies. (Table 3).

REVISED KEY TO ARISTOLOCHIA IN THE FLORA OF THAILAND (1987) (vegetative characters)

1. Stem zigzag, petiole less than 0.5 cm long
2. Leaves sessile or subsessile, apex rounded
   1. A. arenicola
3. Leaves petiolate, apex acute or obtuse
   2. Leaves petiolate, apex acute or obtuse
   3. Blad lanceolate or ovate, much longer than wide, more than 6 cm long
   2. A. harmandiana
   3. A. helix
   1. Stem not zigzag, petiole more than 1 cm long
4. Leaves lobed
   5. Leaves deeply 3-lobed, middle lobe acuminate, lateral lobes sickle-shaped, obtuse
   4. A. curtisii
   6. A. pothieri
5. Leaves without lobes
   7. Leaves with lobes not exceeding half the length of blade
5. A. pothieri
6. Leaves entire
7. Leaves as long as broad or slightly longer than broad
8. Pseudo-stipules large, leaf-like; flowers solitary
   9. Leaves rounded or kidney-shaped
   10. A. ringens
   9. A. elegans
9. Leaves triangular
8. Pseudo-stipules absent; flowers not solitary
10. Inflorescence contracted, flowers many (15–20)
   11. Leaves glabrous on both sides or at most pubescent on nerves
   12. Leaves narrowly lanceolate, 5.5–8.5 by 2–3.5 cm, base shallowly cordate, not auriculate
   15. A. hansenii
   12. Leaves ovate to ovate-lanceolate, base deeply cordate, ± auriculate
   13. Leaves small, 5–7.5 by 3–4 cm
   16. A. kongkandae
   8. A. tagala
   13. Leaves large, 9.5–16.5 by 5.8–7.6 cm
11. Leaves puberulous beneath
14. Leaves more than 3 times longer than wide, narrowly oblong-lanceolate, apex acute or tapering acute
   15. Leaves base shallowly cordate, not auriculate, finely pubescent towards the margin on upper surface
   15. A. pierrei
   15. Leave base deeply cordate, auriculate, margin glabrous
   17. A. perangustifolia
14. Leaves less than 3 times longer than wide, triangular-ovate to ovate lanceolate
   16. Leaves base truncate, shallowly cordate to cordate, apex acute
   10. A. kerrii
   16. Leaves base deeply cordate, auriculate, apex acuminate
   17. Petiole less than 3 cm long, leaves 5.5–9 by 2.5–3.8 cm
   18. A. poomae
   17. Petiole more than 4 cm long, leaves 7–12 by 4.5–8 cm
   19. A. yalaensis
6. Leaves pinnately nerved
18. Petiole short, 1–2 cm
16. A. versicolor
Figure 5. *Aristolochia yalaensis* Phup.: A. flowering branch; B. inflorescences; C. gynostemium. Drawn by P. Inthachup.
18. Petiole long, 8–10 cm
19. Base of leaves obtuse or cuneate, apex obtuse
19. Base of leaves cordate, apex acuminate

**Key to the species**
(flower and fruit characters)

1. Flowers solitary
2. Flowers bent, more than 7 cm long; pedicels 6.5–8.5 cm
   3. Perianth 2-lipped; utricle more than 4 cm long
   3. Perianth limb orbicular; utricle less than 3 cm long
   2. Flowers straight, less than 5 cm long; pedicels 0.4–1.5 cm
   4. Perianth more than 2.5 cm long, outside densely hairy
   4. Perianth less than 2 cm long, outside glabrous

1. Flowers in racemes or panicles
5. Flowers in panicles; seeds winged
   6. Panicles lax; seeds (incl. the wing) as long as broad or slightly broader than long, seed proper conspicuously heart-shaped
   7. Panicles dense at the base; seeds (incl. the wing) longer than broad, seed proper nearly orbicular
5. Flowers in racemes
7. Bracts amplexicaul; seeds not winged, verrucose on both sides
7. Bracts not amplexicaul
8. Limb around the throat
9. Pedicel more than 3 cm; perianth outside white with brown veins, inside yellow, limb red; stigmatic lobes 6
9. Pedicel less than 3 cm; perianth outside pilose, inside glabrous; stigmatic lobes 3
10. Leaves widest above middle, without basal sinus; flowers borne on trailing stems above ground
10. Leaves widest below middle, with conspicuous basal sinus; flowers borne close to the ground

8. Limb 1-lipped
11. Perianth and fruits velutinous outside; pedicel 0.6–0.75 cm; seeds not winged
12. Perianth glabrous outside
13. Stipe between ovary and utricle absent
14. Gynostemium with wavy annular ring between stigmatic lobes and anthers; lip tapering to a long tail
15. Fruit more than 5 cm long; raceme not fascicled
15. Fruit less than 2.5 cm long; raceme fascicled
13. Stipe between ovary and utricle present
16. Fruit small, globose, 5–7 mm diam.; seed not winged
16. Fruit big, ovoid, 2–2.5 by 1.8–2 cm; seed winged
12. Perianth pubescent or laxly hairy outside
17. Stipe between ovary and utricle present
18. Limb hairy on adaxial surface; fruit ovoid up to 5.5 cm long; seed winged
18. Limb glabrous on adaxial surface; fruit globose, 8–10 mm diam; seed not winged
17. Stipe between ovary and utricle absent
19. Lip long, up to 16 mm; utricle oblong to ovate-oblong 5–6 by 3–4 mm; stigmatic lobes short, about 0.3 by 0.7 mm, apex obtuse to truncate
19. Lip short, about 10 mm; utricle ovoid to globose, about 3 mm diam; stigmatic lobes longer, 0.5–0.7 by 0.5 mm, apex acute
19. A. yalaensis

Figure 6. Aristolochia kongkandae Phup.: A. flowers; B. fruit; C. habit. Photographed by R. Pooma.
Figure 7. A.-B. *Aristolochia yalaensis* Phup.; C. *Aristolochia poomae* Phup. Photographed by R. Pooma.
ACKNOWLEDGEMENTS

I am greatly indebted to Dr. K. Chayamarit Director, Office of the Forest Herbarium, for her valuable advice and for the collection of interesting plants, Dr. R. Pooma for the collection of plants and his photographs, Dr. S. Suddee for suggesting the Latin names, N. Pattharahirantricin for her various kinds of help, and P. Inthachub for the line drawings. I am grateful to Dr. H.-J. Esser, who kindly prepared the Latin diagnoses, two anonymous reviewers and Dr. David Middleton for his critical reading and valuable comments on this manuscript.
